RETROFIT UPGRADE OUTER SHELL

Coated outer shell applicable for sulphur pastillation plants

The coated outer shell can be added to each sulphur solidification system based on the original Rotoform design.

By adding the coated outer shell the refeed bar system can be fully removed. This is having a major impact on the uptime because of less maintenance efforts. Overall product quality is improving; dust will be reduced to the minimum possible. The total handling of the equipment will be simplified. The weekly exchange of the refeed bar sealing is not needed anymore.

Coated shell

Advantages

- Superb release effect.
- Can be recoated in terms of need.
- Maintenance free (no refeed bar with respective sealing needed).
- Significant quality increase.
- Reduction of dust.
