Release agent system: ProForm

IPCO ProForm combines our ProMix and ProSpray systems to create a complete, purpose designed release agent system that ensures optimum performance on steel belt cooling / solidification lines.

ProMix automates the mixing of water and Tegopren release agent, ensuring a uniform ratio for precise dosing, optimum performance and most economical use of materials. ProSpray is an advanced spraying bar system that delivers the release agent to the steel belt.

Together they ensure that pastilles are removed from the belt more efficiently, preventing damage to the product and reducing the amount of dust.

- Complete package solution from a single source.
- System components designed together to work together.
- Automated operation of both systems.
- Low maintenance, low operation costs.
- Compact design for easy system upgrade.
